Title: E-Commerce Website for Online Shopping

1. Project Problem Statement

The primary challenge addressed by this project is the need for a comprehensive, user-friendly digital storefront that facilitates the online buying and selling of tangible goods, digital products, or services. Modern consumers require a seamless shopping experience that spans from initial product discovery to secure checkout.

Specifically, the project addresses the following functional gaps:

- **Navigation & Discovery:** Providing a structured way for users to find products via categories and search functionality.
- **Information Accessibility:** Ensuring users have access to detailed product views, including images, descriptions, ratings, and pricing.
- **Transaction Flow:** Creating a logical progression from adding items to a cart, managing quantities, and completing a secure checkout with order confirmation.
- **User Trust & Support:** Establishing credibility through "About Us" and "Contact Us" sections to handle customer inquiries and provide business transparency.

2. Project Solution

To solve these challenges, I developed a multi-page e-commerce platform designed with a focus on User Experience (UX) and functional consistency. The solution includes a persistent navigation bar and footer across all pages for ease of use.

Methodology & Tools Used

- **Front-End Structure:** HTML5 was used to build the semantic structure of the 10 required pages (Home, Products, Cart, etc.) .
- **Styling & Layout:** CSS was employed to create a responsive design, featuring image sliders, product grids, and a "Scroll to Top" button for enhanced navigation.
- **Interactivity & Validation:** JavaScript and jQuery were utilized specifically for the Contact Form to ensure data integrity through submit form validation.
- **Data Management:** Logic was implemented to handle product filtering by category and price range, as well as managing total amounts within the shopping cart.

Core Features Implemented

- **Dynamic Home Page:** Features a slider and "Shop by Category" section to drive user engagement.
- **Streamlined Checkout:** A two-step process involving an Order Summary and a Shipping Information Form to reduce cart abandonment.
- **Confirmation System:** A dedicated page providing the user with an Order Number and status to finalize the transaction experience.
